

# WEEK 11:

1.

Write a Python program that asks the user for their age and prints a message based on the age. Ensure that the program handles cases where the input is not a valid integer.

**Input Format:** A single line input representing the user's age.

**Output Format:** Print a message based on the age or an error if the input is invalid.

**For example:**

Input	Result
twenty	Error: Please enter a valid age.
25	You are 25 years old.
-1	Error: Please enter a valid age.

```
try:  
    a=input()  
    if(len(a)==0):  
        print("Error: Please enter a valid age.")  
    elif a.isnumeric():  
        print("You are",a,"years old.")  
    else:  
        print("Error: Please enter a valid age.")
```

except:

```
print("Error: Please enter a valid age.")
```

## OUTOUT:

Input	Expected	Got
twenty	Error: Please enter a valid age.	Error: Please enter a valid age.
25	You are 25 years old.	You are 25 years old.
-1	Error: Please enter a valid age.	Error: Please enter a valid age.
150	You are 150 years old.	You are 150 years old.
	Error: Please enter a valid age.	Error: Please enter a valid age.

Passed all tests!

Correct

## 2.

### Problem Description:

Write a Python program that asks the user for their age and prints a message based on the age. Ensure that the program handles cases where the input is not a valid integer.

### Input Format:

A single line input representing the user's age.

### Output Format:

Print a message based on the age or an error if the input is invalid.

### For example:

Input	Result
25	You are 25 years old.
rec	Error: Please enter a valid age.

Input	Result
-5	Error: Please enter a valid age.

```

try:
    a=input()
    if(len(a)==0):
        print("Error: Please enter a valid age.")
    elif a.isnumeric():
        print("You are",a,"years old.")
    else:
        print("Error: Please enter a valid age.")
except:
    print("Error: Please enter a valid age.")

```

## OUTPUT:

Inpu t	Expected	Got
25	You are 25 years old.	You are 25 years old.
rec	Error: Please enter a valid age.	Error: Please enter a valid age.
!@#	Error: Please enter a valid age.	Error: Please enter a valid age.

Passed all tests!

Correct

## 3.

### Problem Description:

Write a Python script that asks the user to enter a number within a specified range (e.g., 1 to 100). Handle exceptions for invalid inputs and out-of-range numbers.

### Input Format:

User inputs a number.

### Output Format:

Confirm the input or print an error message if it's invalid or out of range.

### For example:

Input	Result
1	Valid input.
101	Error: Number out of allowed range
rec	Error: invalid literal for int()

```
def main():

    min_range = 1

    max_range = 100

    try:

        num = int(input())

        if num < min_range or num > max_range:

            print("Error: Number out of allowed range")

        else:

            print("Valid input.")

    except ValueError:

        print("Error: invalid literal for int()")
```

```
if __name__ == "__main__":
```

## OUTPUT:

Input	Expected	Got
1	Valid input.	Valid input.

Input	Expected	Got
100	Valid input.	Valid input.
101	Error: Number out of allowed range	Error: Number out of allowed range

Passed all tests!

Correct

Marks for this submission: 1.00/1.00.

## 4.

Develop a Python program that safely performs division between two numbers provided by the user. Handle exceptions like division by zero and non-numeric inputs.

**Input Format:** Two lines of input, each containing a number.

**Output Format:** Print the result of the division or an error message if an exception occurs.

**For example:**

Input	Result
10 2	5.0
10 0	Error: Cannot divide or modulo by zero.
ten 5	Error: Non-numeric input provided.

```
def main():
    try:
        num1 = float(input())
        num2 = float(input())

        division_result = num1 / num2
```

```

modulo_result = num1 % num2

print(division_result)

except ValueError:
    print("Error: Non-numeric input provided.")

except ZeroDivisionError:
    print("Error: Cannot divide or modulo by zero.")

if __name__ == "__main__":
    main()

```

## OUTPUT:

<b>Input</b>	<b>Expected</b>	<b>Got</b>
10 2	5.0	5.0
10 0	Error: Cannot divide or modulo by zero.	Error: Cannot divide or modulo by zero.
ten 5	Error: Non-numeric input provided.	Error: Non-numeric input provided.

Passed all tests!

Correct

## 5.

### Problem Description:

Develop a Python program that safely calculates the square root of a number provided by the user. Handle exceptions for negative inputs and non-numeric inputs.

**Input Format:**

User inputs a number.

**Output Format:**

Print the square root of the number or an error message if an exception occurs.

**For example:**

Input	Result
16	The square root of 16.0 is 4.00
-4	Error: Cannot calculate the square root of a negative number.
rec	Error: could not convert string to float

try:

```
a=float(input())
if(a<0):
    print("Error: Cannot calculate the square root of a negative number.")
else:
    print("The square root of",a,"is {:.2f}".format(a**0.5))
except:
    print("Error: could not convert string to float")
```

## OUTPUT:

Input	Expected	Got
16	The square root of 16.0 is 4.00	The square root of 16.0 is 4.00
0	The square root of 0.0 is 0.00	The square root of 0.0 is 0.00
-4	Error: Cannot calculate the square root of a negative number.	Error: Cannot calculate the square root of a negative number.

Passed all tests!

Correct
